

Schedule Importer AI – Ground Zero Setup Checklist

Python / FastAPI-based implementation

1. System Prerequisites

- Python 3.11 or 3.12 installed and available in PATH.
- Git installed for version control.
- Code editor (VS Code recommended).
- Optional: Docker Desktop for database and deployment parity.

2. Accounts and API Keys (Do Before Coding)

- Google Cloud account and project.
- Enable Google Calendar API.
- Configure OAuth consent screen (add yourself as test user).
- Create OAuth Client ID (Web application).
- Create OpenAI API key.

3. Local Infrastructure Decisions (MVP)

- Database: SQLite for local MVP; PostgreSQL later.
- Image storage: local disk initially; cloud storage later.

4. Recommended Project Structure

app/ (main.py, routes/, services/, models/, schemas/, core/), tests/, .env, requirements.txt

5. Core Python Dependencies

- fastapi, uvicorn[standard]
- httpx, python-dotenv or pydantic-settings
- google-auth, google-auth-oauthlib, google-api-python-client
- cryptography, python-jose or itsdangerous
- sqlalchemy or sqlmodel (optional for DB).

6. Environment Variables to Prepare

- OPENAI_API_KEY
- GOOGLE_CLIENT_ID
- GOOGLE_CLIENT_SECRET
- GOOGLE_REDIRECT_URI
- APP_SECRET_KEY

- TOKEN_ENCRYPTION_KEY
- DEFAULT_TIMEZONE

7. Verification (Smoke Tests)

- FastAPI server starts successfully.
- Swagger UI accessible at /docs.
- Environment variables load correctly.

8. Recommended Build Order

- FastAPI skeleton + health endpoint.
- Google OAuth login + callback.
- Create a test Google Calendar event.
- Image upload endpoint.
- AI image → structured JSON extraction.
- Review and commit events to calendar.

9. What to Prepare Before Coding

- 5–10 schedule screenshots for testing.
- Target timezone decision.
- Rules for missing or ambiguous schedule data.
- Frontend approach decision (templates vs React later).
